

Power and Stokes phase sweep — run report

RUN

225409_stokes-phase-sweep_stokes-phase-sweep

Status: completed | Started: 2026-09-23T21:54:09.514568+00:00

PURPOSE

Measure synchronized optical power and Stokes parameters while sweeping an external phase actuator. Repeated OUT1 sine cycles; IN1 is the measured voltage reference, with acquisition timing retained.

REQUIRED OPTICAL SETUP

PAX in path A / E4, observing the combined field. OUT1 drives phi1 and is physically T-ed into IN1 as the voltage reference (not a photodiode). OUT2 stays at zero.

RECORDED BENCH CONTEXT (RECIPE)

In front of NPBS 1, C port

Red Pitaya (0-1 V command) -> Thorlabs MDT690 -> piezo

OPERATOR SETUP NOTES

V_pi expectation only; verify channel and measured driver gain before calibration.

DATA

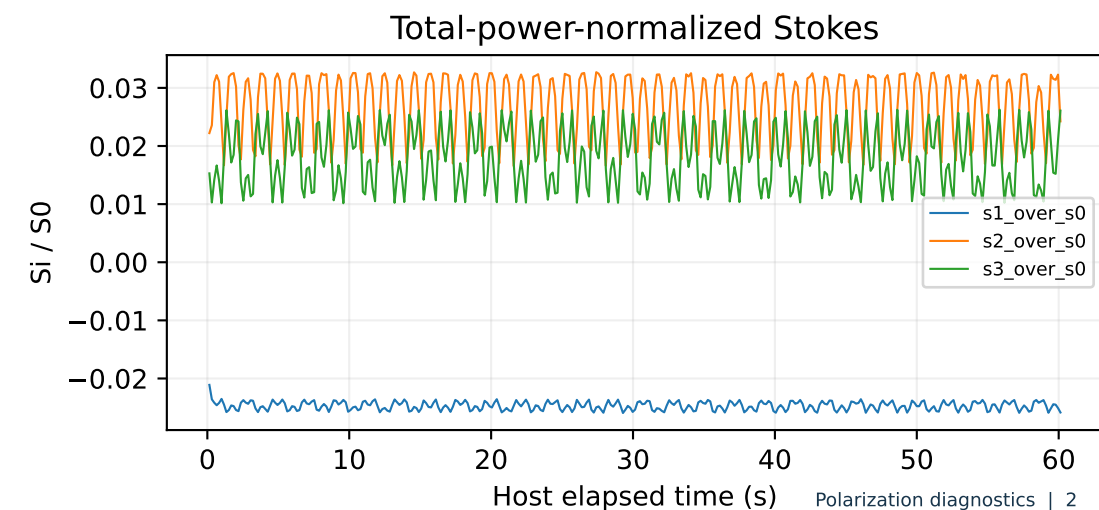

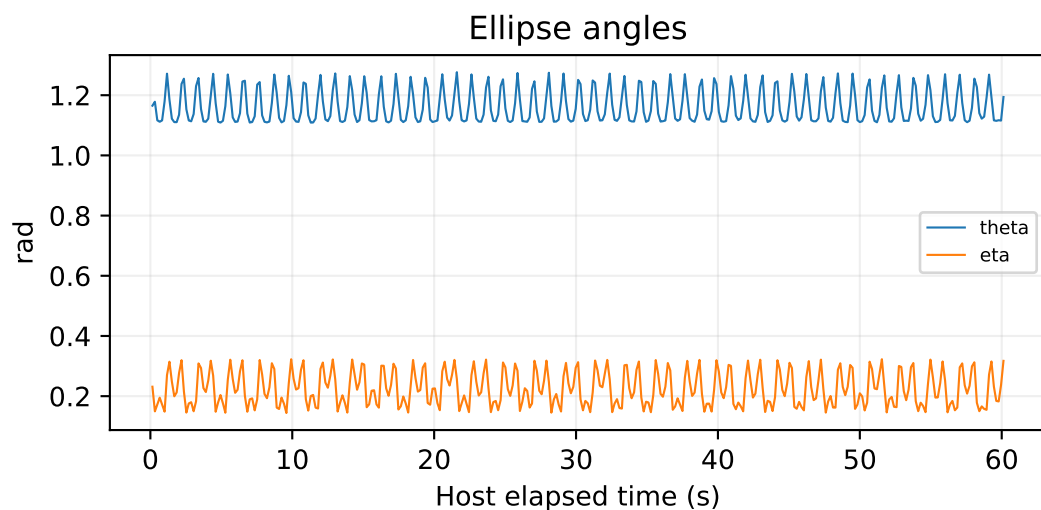

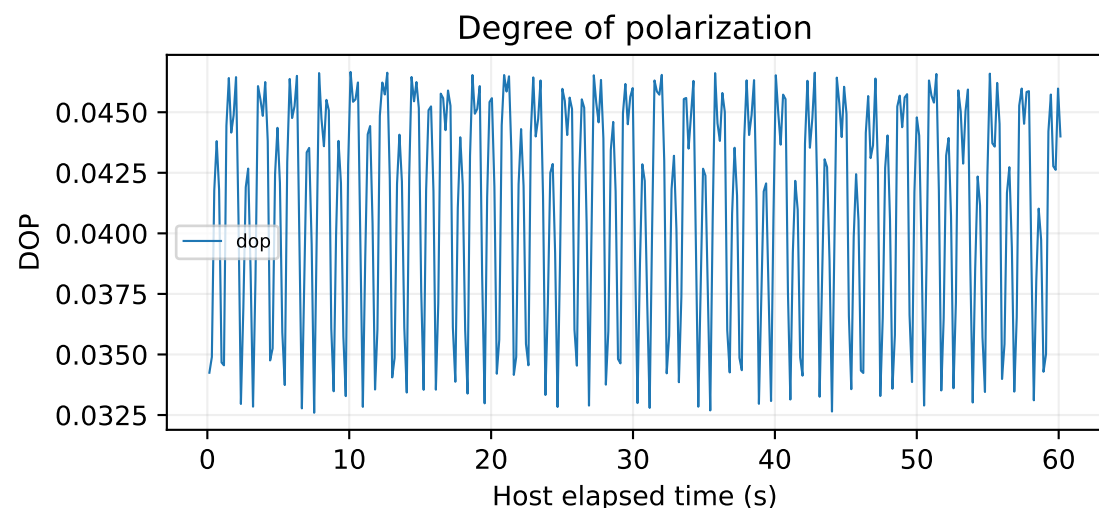

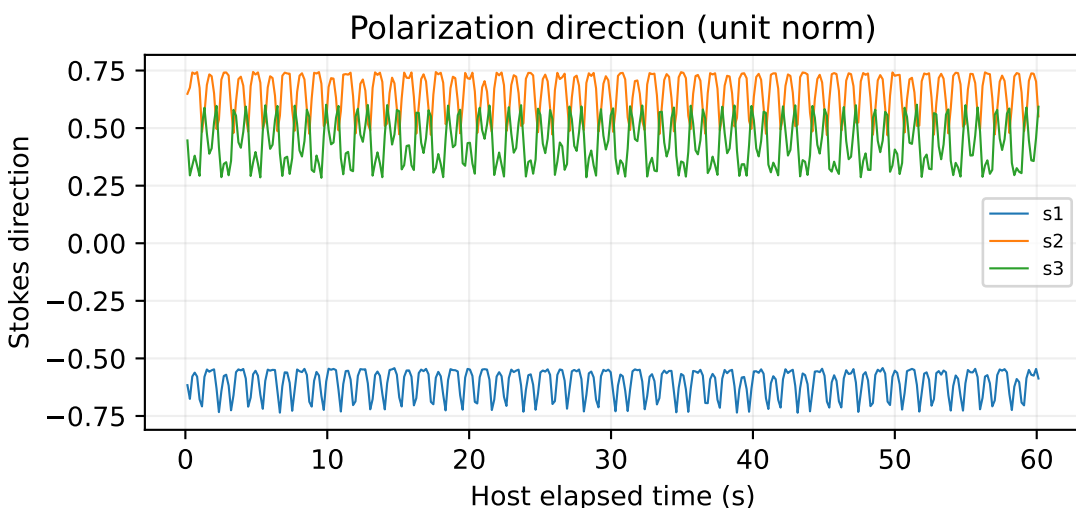

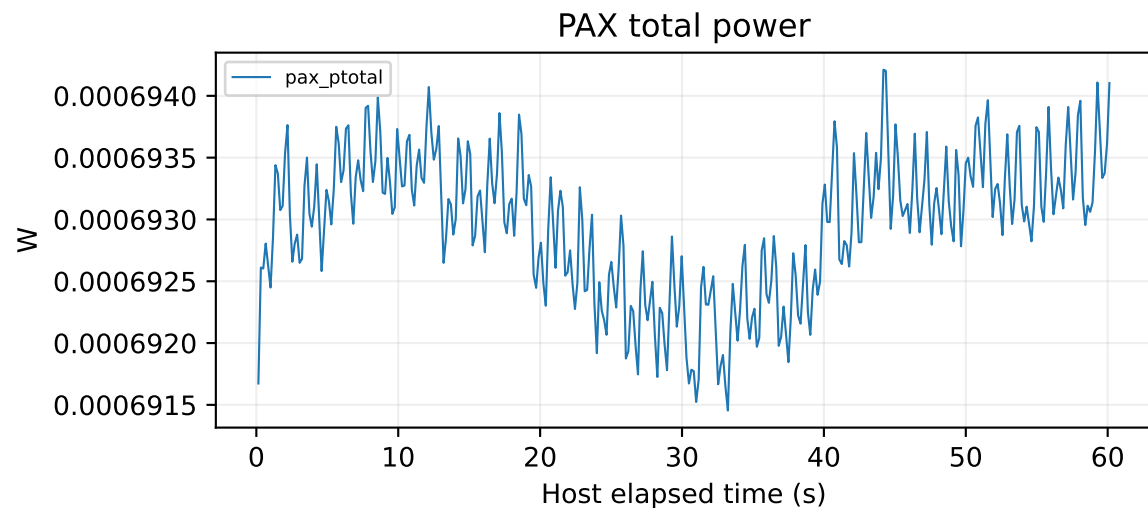

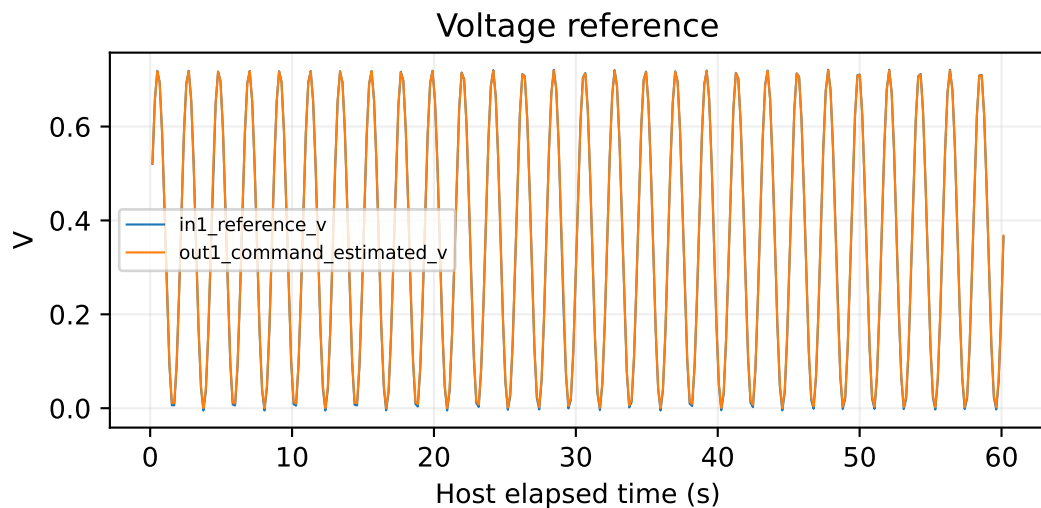

351 recorded samples; acquisition: 351

Source: data.csv; full acquisition settings: recipe.json; status: run.json

RAW DOP

Mean 0.0411; range 0.0326 to 0.0467. 0 samples outside 0–1. Telemetry is not a new calibration.

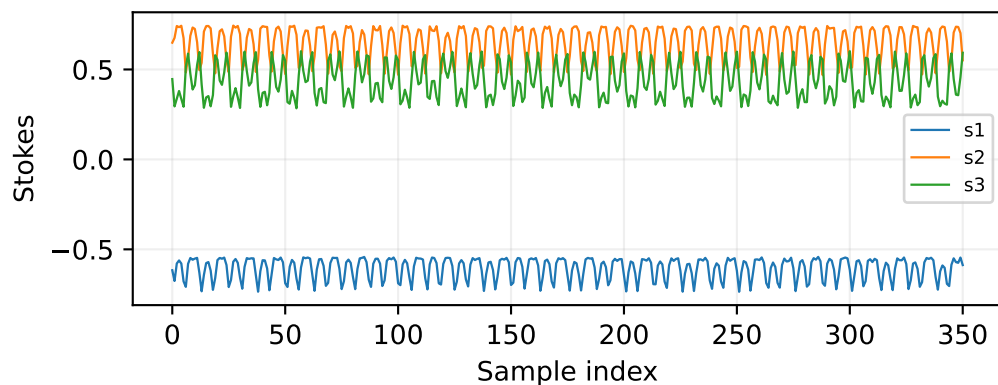

Power and Stokes versus phase-actuator drive

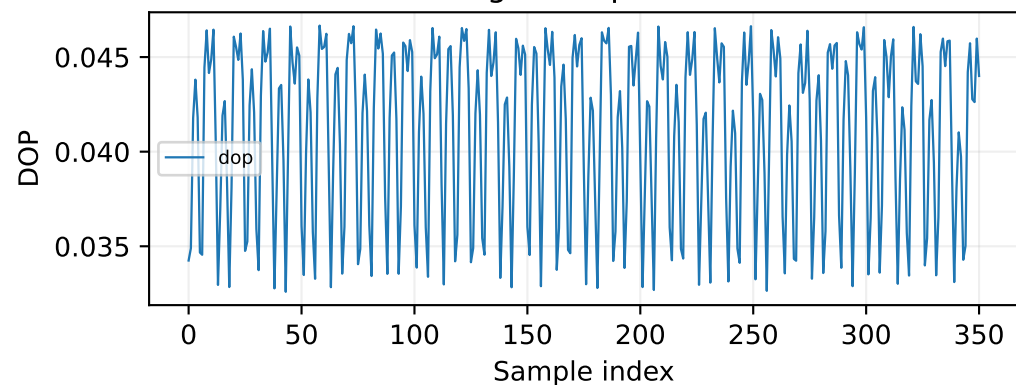

Recorded telemetry

Acquisition order preserves stage changes; no timing alignment or transfer gain is inferred.

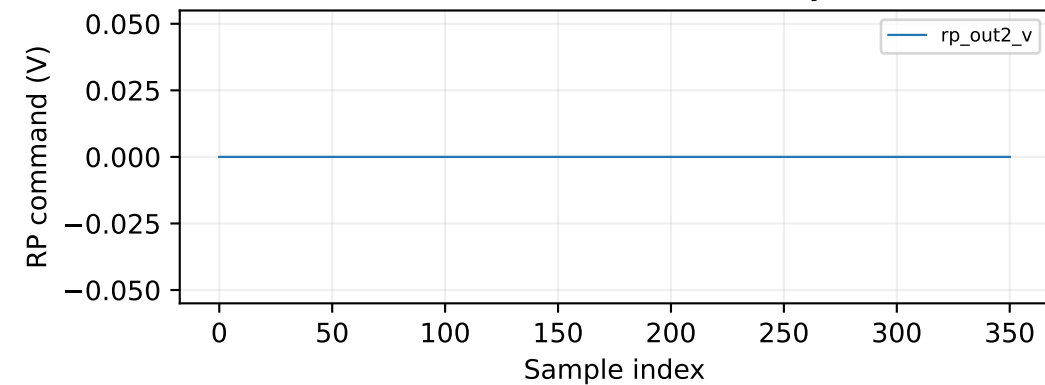

Normalized Stokes

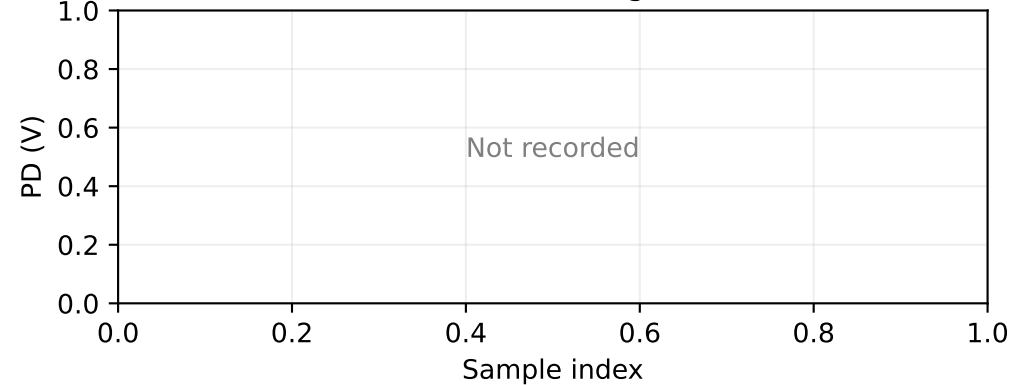

Raw degree of polarization

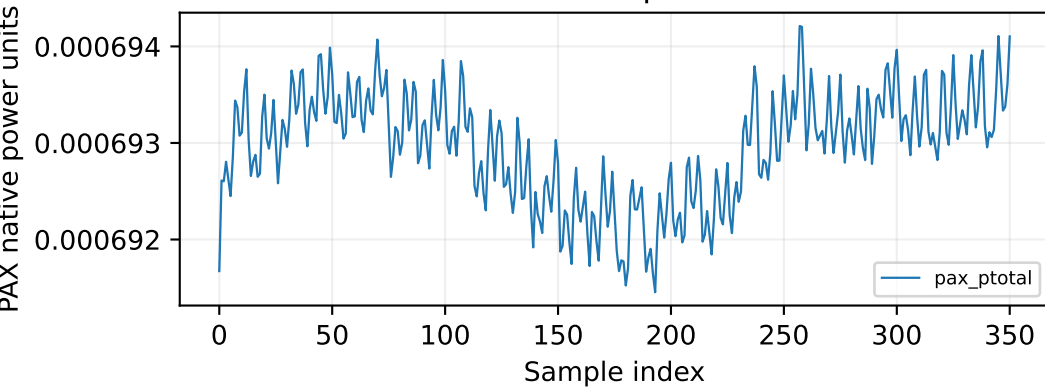

Actuator command history

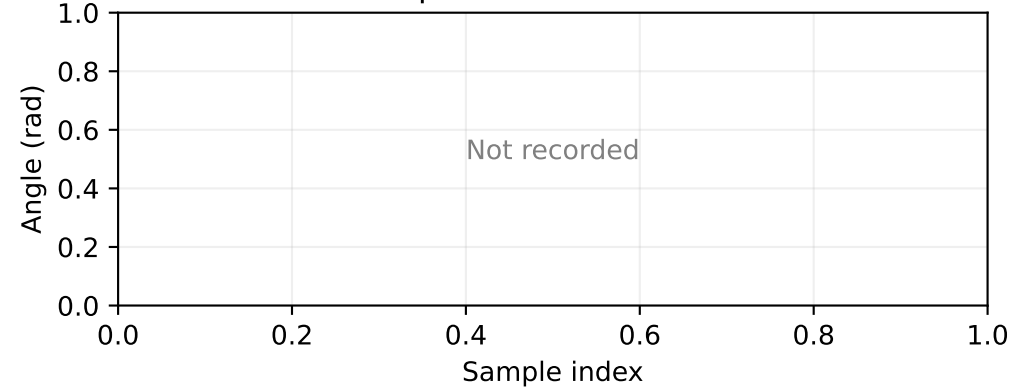

Photodiode signal

PAX total power

Sphere coordinates

Active parameters

RP commands: volts, bounded to 0–1. V_lambda: terminal volts for 2π. Gains: terminal V / RP V.

Parameter	Recorded value
label	"stokes-phase-sweep"
