

PAX path stability — run report

RUN

223357_pax-path-hold_pax-path-hold

Status: completed | Started: 2026-09-21T21:33:57.968743+00:00

PURPOSE

Hold both outputs at zero and record PAX/PD for each manual path condition. Duration is per condition.

REQUIRED OPTICAL SETUP

PAX at final output; both paths open unless prompted. Photodiode connected to configured RP input.

RECORDED BENCH CONTEXT (RECIPE)

In front of NPBS 1, C port

Red Pitaya (0-1 V command) -> Thorlabs MDT690 -> piezo

OPERATOR SETUP NOTES

V_pi expectation only; verify channel and measured driver gain before calibration.

DATA

723 recorded samples; path_a_only: 241, path_b_only: 241, both_paths: 241

Source: data.csv; full acquisition settings: recipe.json; status: run.json

RAW DOP

Mean 0.9554; range 0.7824 to 1.0170. 480 samples outside 0-1. Telemetry is not a new calibration.

Fixed-state PAX path diagnostic — 223357_pax-path-hold_pax-path-hold

Raw DOP while actuator commands are fixed at 0 V

Concurrent, uncalibrated power telemetry

PAX primary-record ADC extrema

Recorded telemetry

Acquisition order preserves stage changes; no timing alignment or transfer gain is inferred.

Normalized Stokes

Raw degree of polarization

Actuator command history

Photodiode signal

PAX total power

Sphere coordinates

Active parameters

RP commands: volts, bounded to 0–1. V_lambda: terminal volts for 2π. Gains: terminal V / RP V.

Parameter	Recorded value
label	"pax-path-hold"
duration_s	60.0
